Lavender Foal Syndrome Genetic Assay

Item	Result
1 GR MAATIN AHA 02893659 - 02893659 Equine Arabian Male Hair	Negative

Lavender Foal Syndrome Genetic Assay A result of POSITIVE HOMOZYGOUS means that the animal has two copies of the gene with the Lavender Foal mutation, and is/was clinically affected. A result of POSITIVE HETEROZYGOUS means that the animal has a single copy of the gene with the Lavender Foal mutation, and is a carrier for the disease. A result of NEGATIVE means that the gene with the Lavender Foal mutation was not detected. A result of INCONCLUSIVE means that the sample did not give a clear result. This is most likely to occur if the sample has not been collected, prepared, or handled according to directions.

Effective September 1st 2010, Clinical Pathology will be increasing the cost of their testing. This increase is necessary to cover the rising cost of reagents and instrumentation. We will continue to provide our high quality of service. We do appreciate your business. A quick list of the new prices is available at <http://ahdc.vet.cornell.edu/pdf/cpfees.pdf>
